## SKID PLATE INSTALLATION INSTRUCTIONS

*IMPORTANT: Use some form of locking compound on bolts! #242 Blue Loc-tite is recommended.*

ALL models listed above use two different sizes of brackets. The large brackets are the front brackets and the small brackets are the rear brackets. Make sure the bottom frame rails are clean. Remove all the brackets from the Skid Plate. The simplest way to mount the Skid Plate is to start with the right rear bracket. Fasten the bracket to the Skid Plate and leave loose for now. Slip the bracket over the frame rail and hold the Skid Plate into position. The Skid Plate will now hang by this bracket. Install the left rear bracket next and finish up with the front brackets. Tighten all four screws to the manufacturers recommended specifications.

TIP-To ensure the Skid Plate mating tightly against the frame rails, we recommend using an impact screwdriver and giving all four fasteners two to three light hits.
