

Part #10-102 Skid Plate Instructions

IMPORTANT: USE SOME FORM OF LOCKING COMPOUND ON BOLTS. WE RECOMMEND # 242 BLUE LOC-TITE FOR BEST RESULTS.

This particular Skid Plate uses (2) different mounting brackets. The right rear (under kick-starter) is shorter than the other (3) brackets. This is done for clearance reasons under the engine case. The easiest way to install the skid plate is to remove all brackets. Fasten the right rear (shorter) bracket to the skid plate (leave very loose). You can now position skid plate in place and slip the right rear bracket over the frame tube under the kick starter. All the other (3) brackets are identical and can now be installed to the skid plate. Once all four brackets are in place position skid plate where the fit is best, and tighten all (4) bolts.
